# Exploring the need for, and design of, a community "lung health" service for COPD patients in China: A Mixed Method Study from the Breathe Well programme

Hui Pang, Eleanor Duncan, Zihan Pan, Rachel Adams, Alexandra Enocson, Peymané Adab, Xia Kong, Chunhua Chi, Rachel E Jordan

On behalf of the Breathe Well investigators

### Introduction

#### • Background:

 Pulmonary rehabilitation and self-management support are very effective interventions for COPD but not currently available in China

#### • Aims:

- To describe management and understanding of COPD reported by patients in China
- To explore patient & GP opinions on current management of COPD and a future "lung health" service
- Design: Convergent mixed methods (questionnaire and focus groups)

#### **Methods**

- **Population:** COPD patients and GPs
- Eligibility criteria: Patients = clinical diagnosis, GPs = manage COPD
- Data collection:
  - Patient questionnaires
  - Focus groups: 2x patient, 2x GP (n=4 in total)
- Data analysis: Questionnaire = descriptive statistics, FG = framework analysis
- Research site: Beijing
- Sample size:
  - Questionnaire : n=96 (85% male)
  - Focus groups: n=16 (11 male) patients, n=11 (2 male) GPs
- Additional data: Currently being collected from 3 other Chinese cities

## **Questionnaire** (n=96)

#### Patients' knowledge of COPD

- Most knew the name of disease (81%)
- Perceived causes of COPD: smoking (59%), second-hand smoke (55%), air pollution (52%)
- Exacerbation triggers: cold/flu (68%), second-hand smoke (62%), air pollution (58%)

#### **Current management**

- Treatment: daily Inhalers (79%), oral medication (51%), emergency inhalers (33%)
- Over half reported no prognosis, dietary, exercise or exacerbation management advice
- Cost was not a problem (96%)

#### **Patients' view on Lung Health Service**

- Most willing to participate (80%)
- Distance from home most important factor for attendance (62%)
- Content requested: breathing techniques (80%), health education (67%), advice on breathlessness (52%)

## Pilot patient & GP focus groups

# Unmet Needs of Patients

Limited Knowledge of COPD

Physical Challenges of COPD "When I cross the road, even though there are still 20 seconds of green light, I won't go across. When I walk fast I feel breathless"

[Pt: Female, mMRC 2]

Design Factors

Perceived Benefit of PR

Delivery of Patient Education

Training for Doctors "Some doctors
don't even know
how to use the
devices [inhaler] so
we need education
for the general
practitioners too."
[GP: Female]

Cultural Barriers

> Fear of Exercise

Value given to Community Advice

Attitudes to Medication "The COPD patients

can't walk far so
we should avoid
walking and
exercise"
[Pt: Male, mMRC 2]

## **Preliminary conclusions**

- Patients received limited advice or information about their COPD
- Most were willing to participate in a lung health service (LHS)
- These data will be combined with data from other regions and the analysis reviewed
- This research will provide information to design a culturally appropriate COPD LHS

This research was funded by the National Institute for Health Research (NIHR) NIHR global group on global COPD in primary care, University of Birmingham, (project reference: 16/137/95) using UK aid from the UK Government to support global health research. The views expressed in this presentation are those of the author(s) and not necessarily those of the NIHR or the UK Department of Health and Social Care.
